

FlexiShift UX/UI Audit & Refinement Roadmap

A distilled, screen-by-screen breakdown of feedback for the Driver App and Web Portal. This document synthesizes UI optimizations, feature deprecations, and strategic architecture requirements into an actionable development blueprint.

Three strategic pillars drive the next iteration of the FlexiShift ecosystem

Frictionless UX (Simplification)

① Removing system bloat.

Eliminating deprecated features like Fleet Management and stripping unnecessary data fields (weight, vehicle requirements) from the quotation flow.

Real-Time Communication (Connectivity)

① Bridging the gap between driver and haulier. Enabling in-app messaging for job coordination and introducing Uber-style emergency call features.

① Financial & Legal Clarity (Compliance)

① Securing the platform backend.

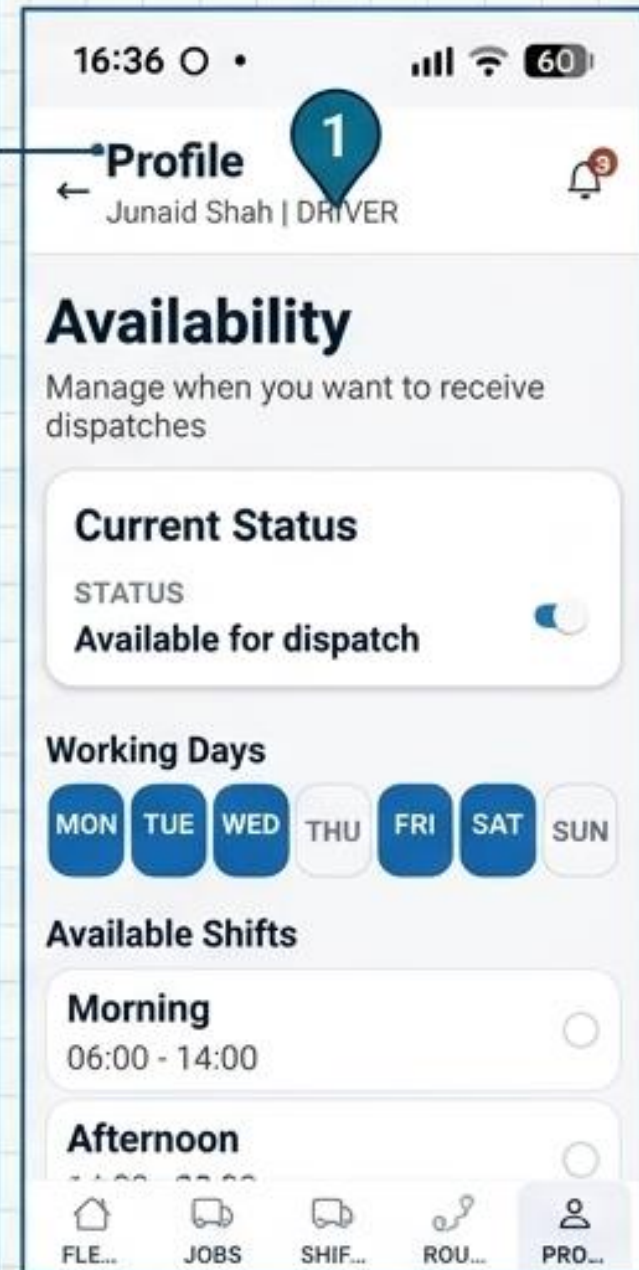

Establishing Stripe and Escrow architectures, streamlining

① Analytics, and enforcing transaction-based driver data retention to ensure legal compliance.

Streamline driver onboarding and focus ratings on objective performance metrics

Additions:

Driver account setup information is currently missing; integrate Stripe setup flow.

Refinements:

Shift to fact-based metrics: display Earnings, Ratings, and Weekly Loads.

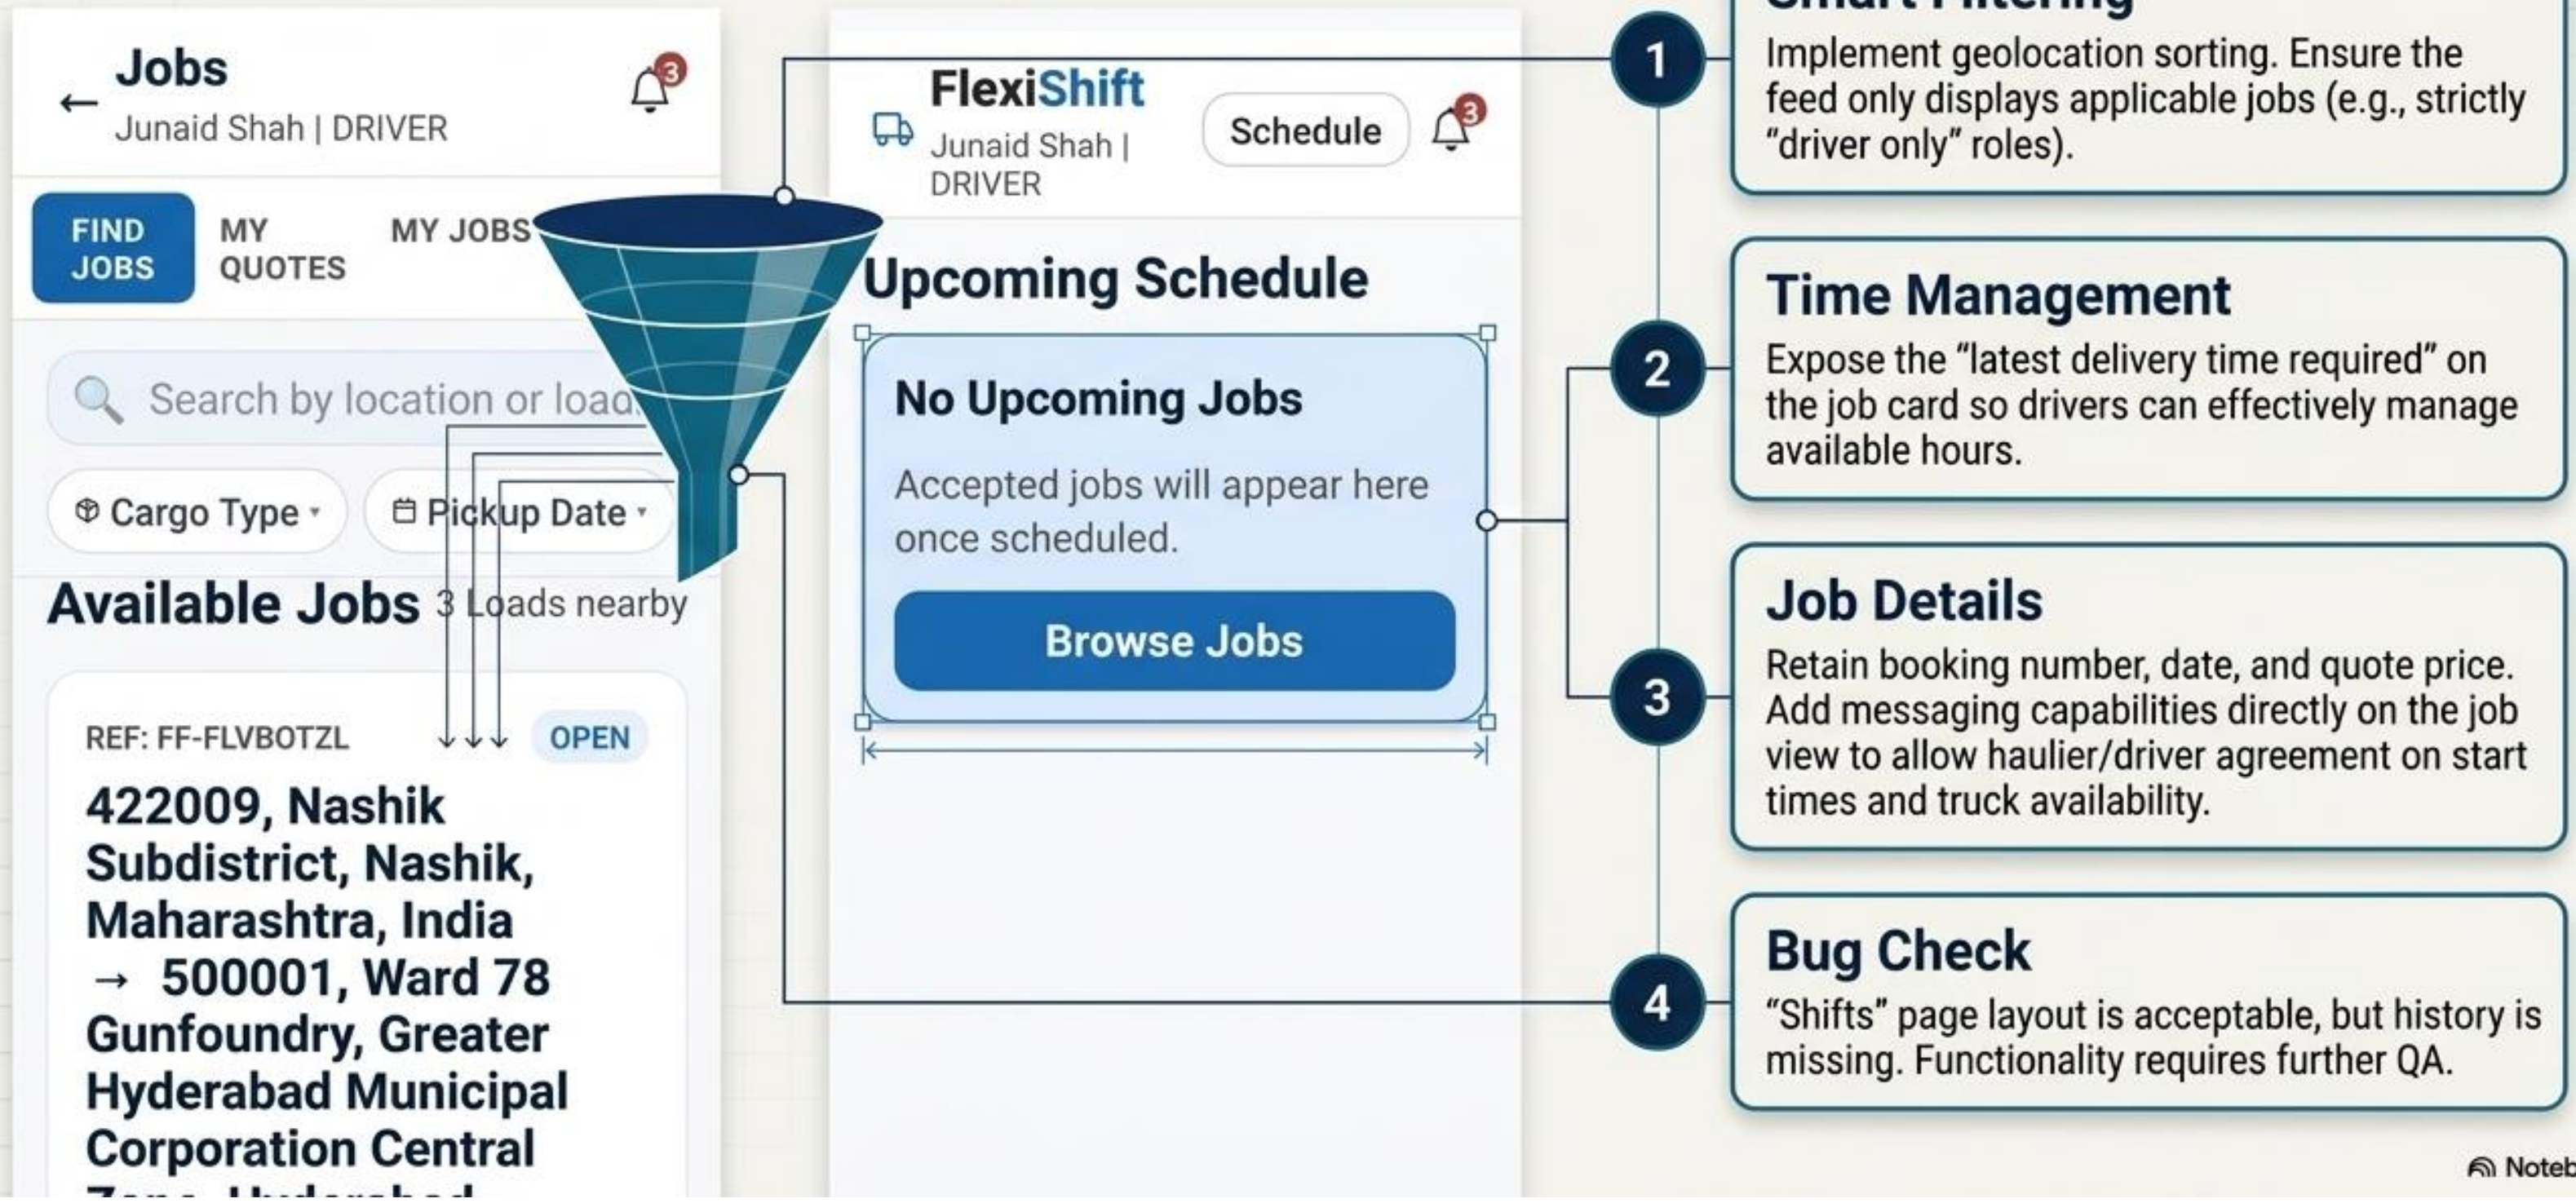

Enforce a mandatory text reason if a 0-star rating is given.

Correct currency formatting system-wide.

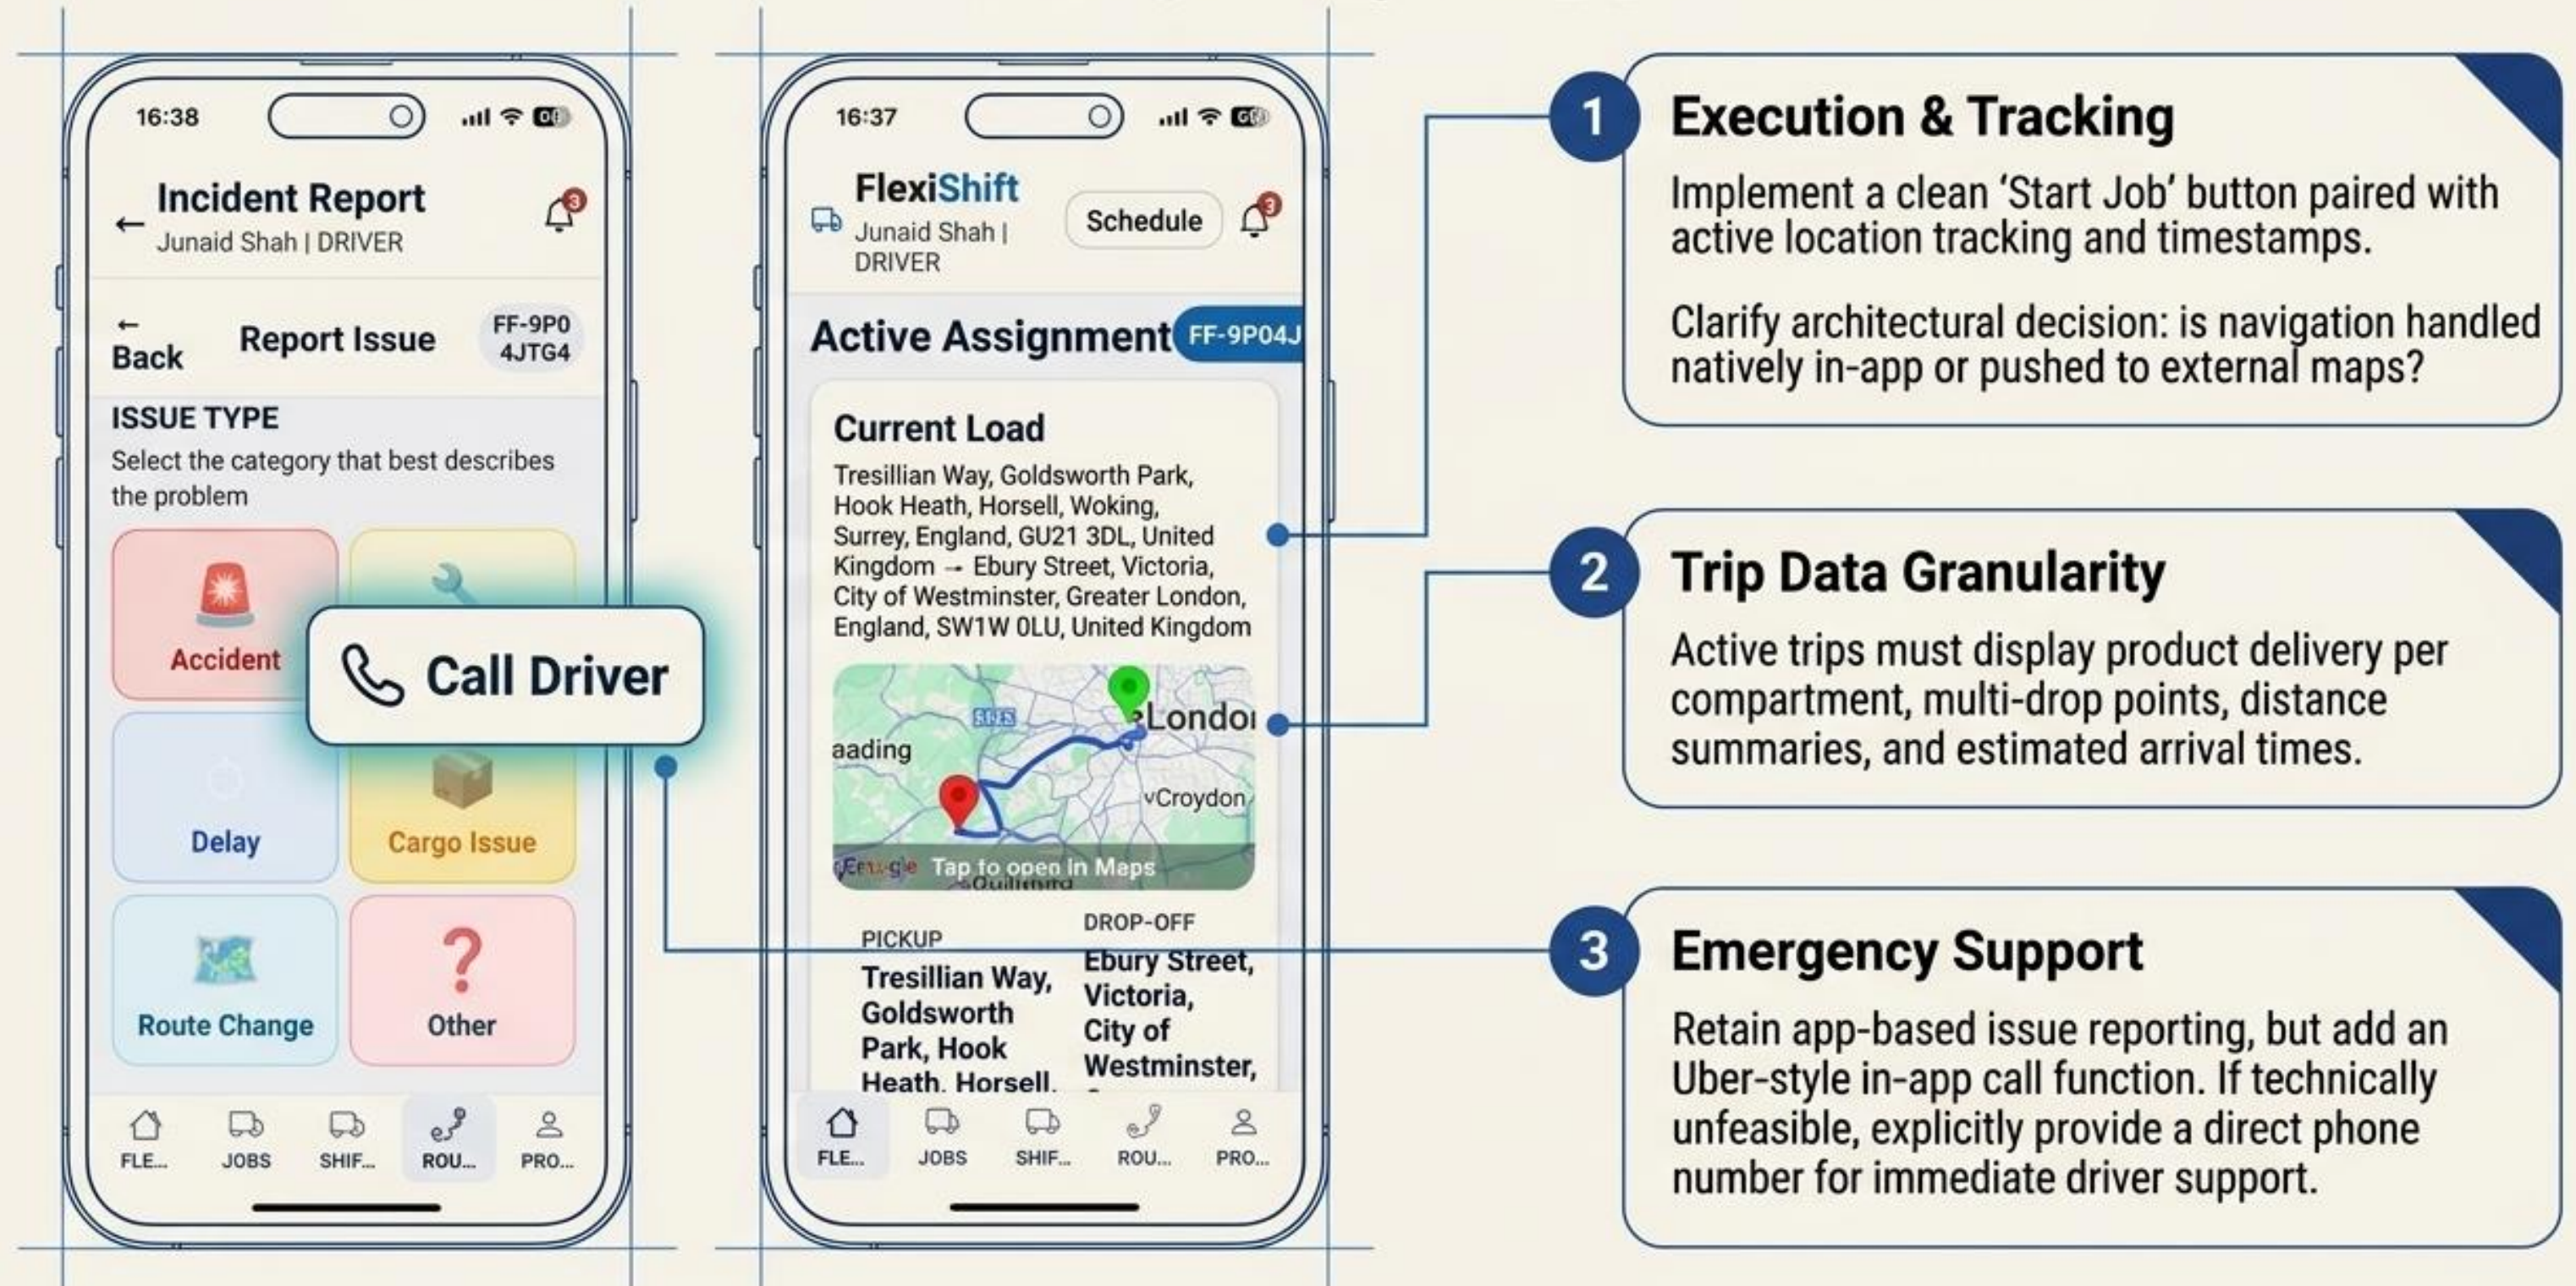

Removals:

The "Driver Schedule" UI is no longer required and should be deprecated.

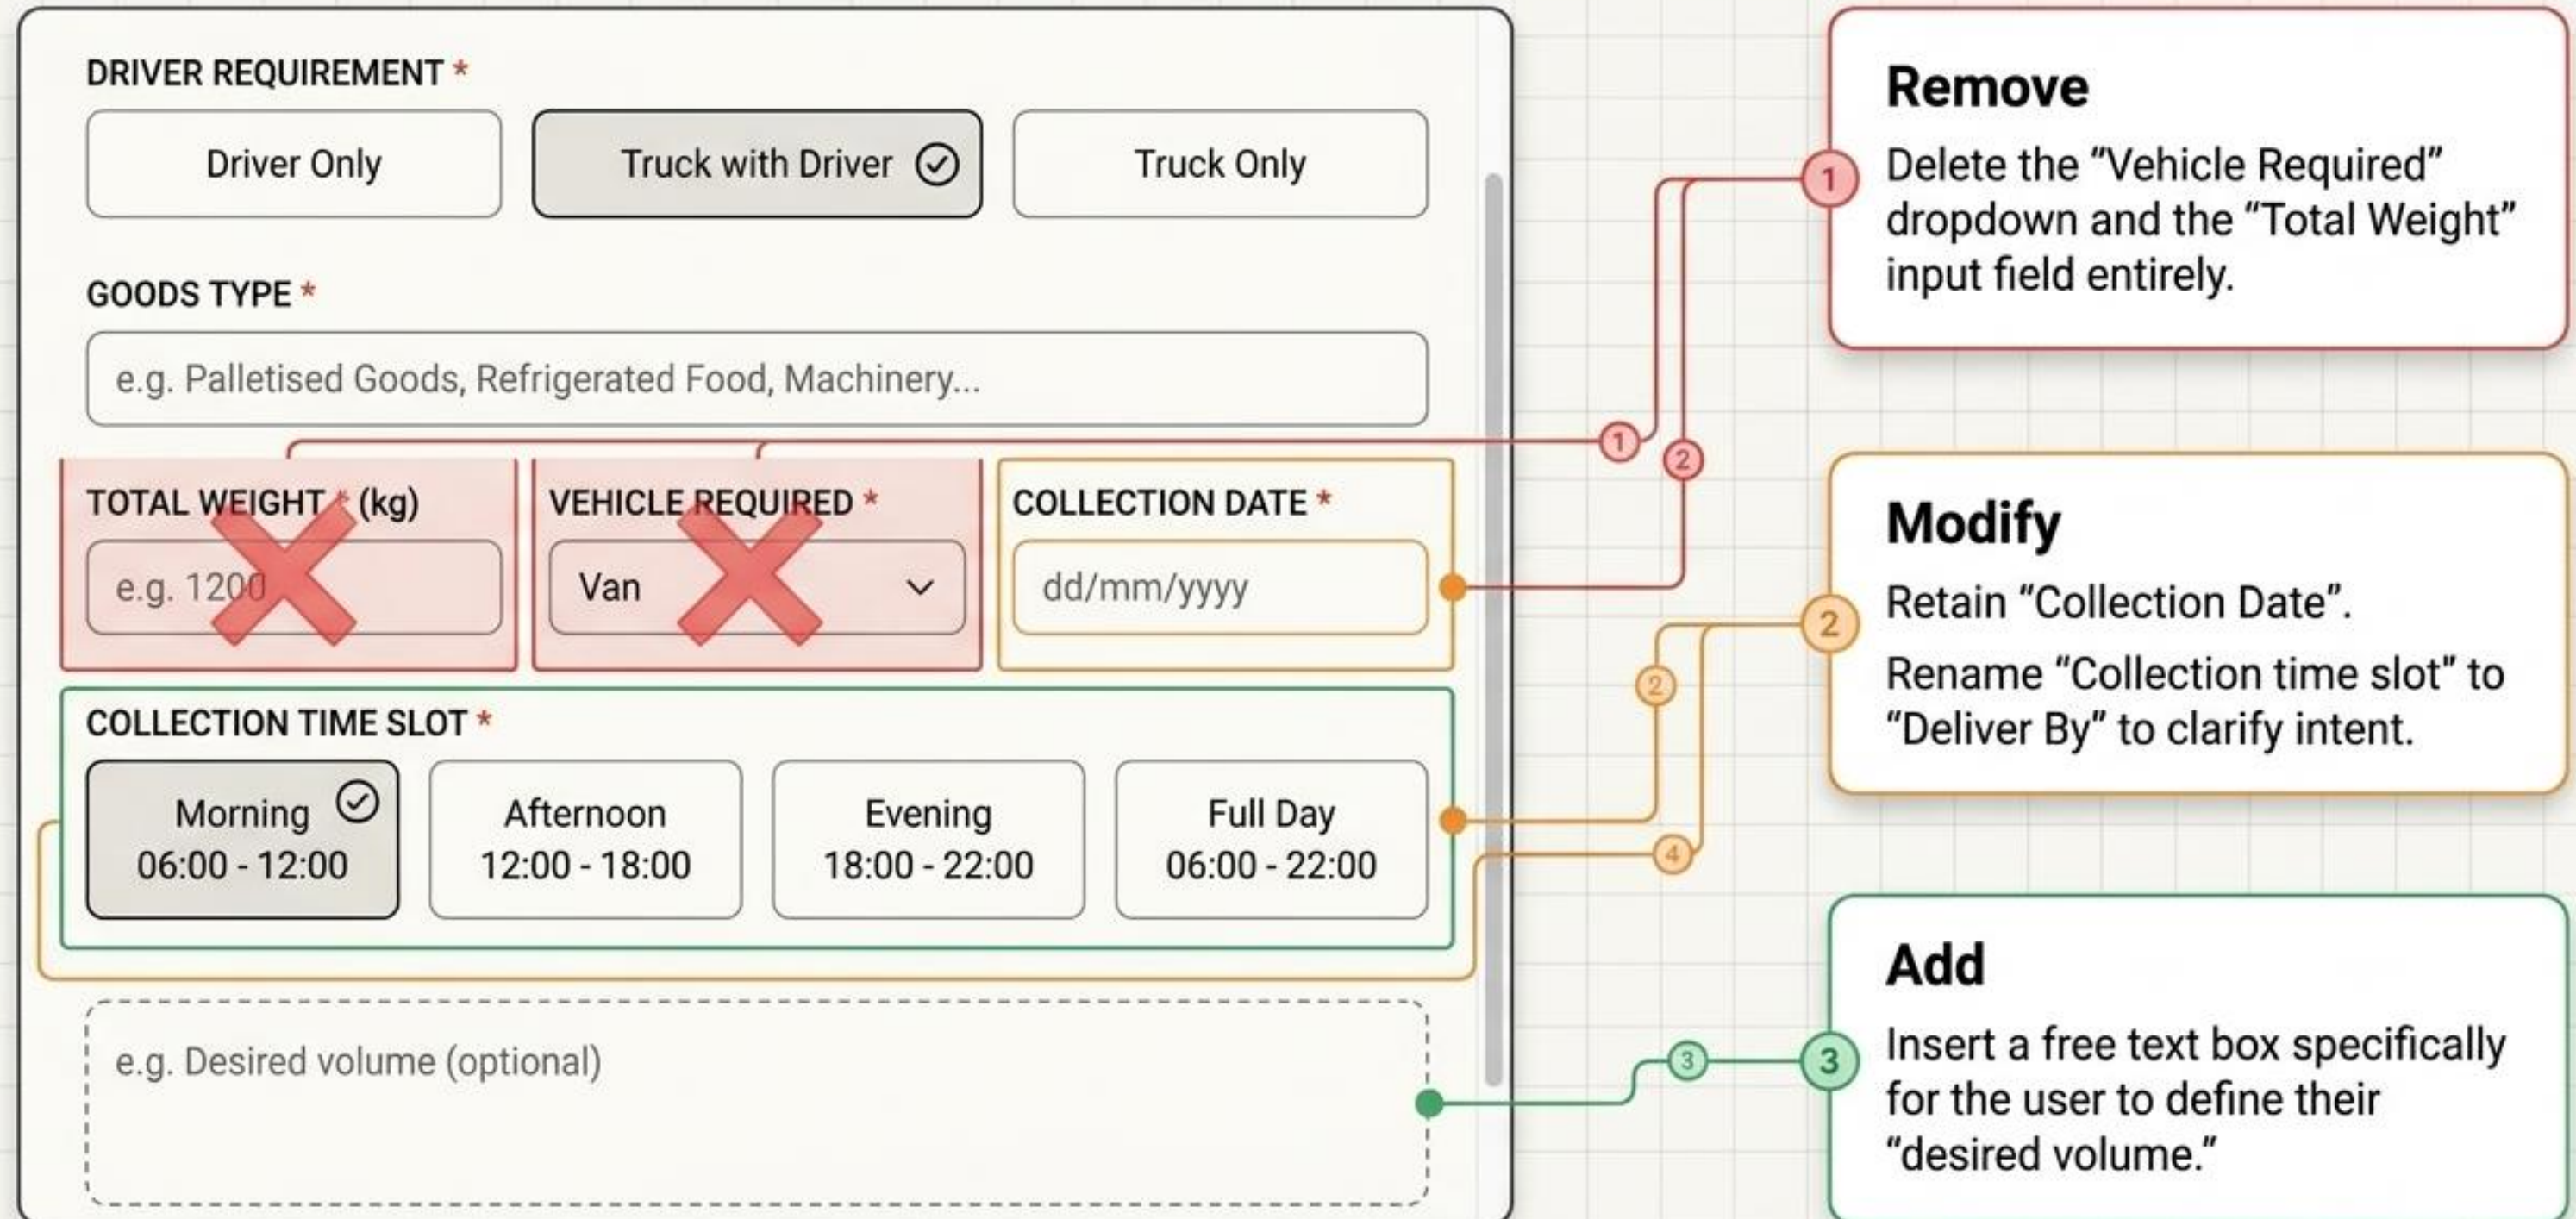

Equip drivers with smart geolocation filtering and precise time management tools

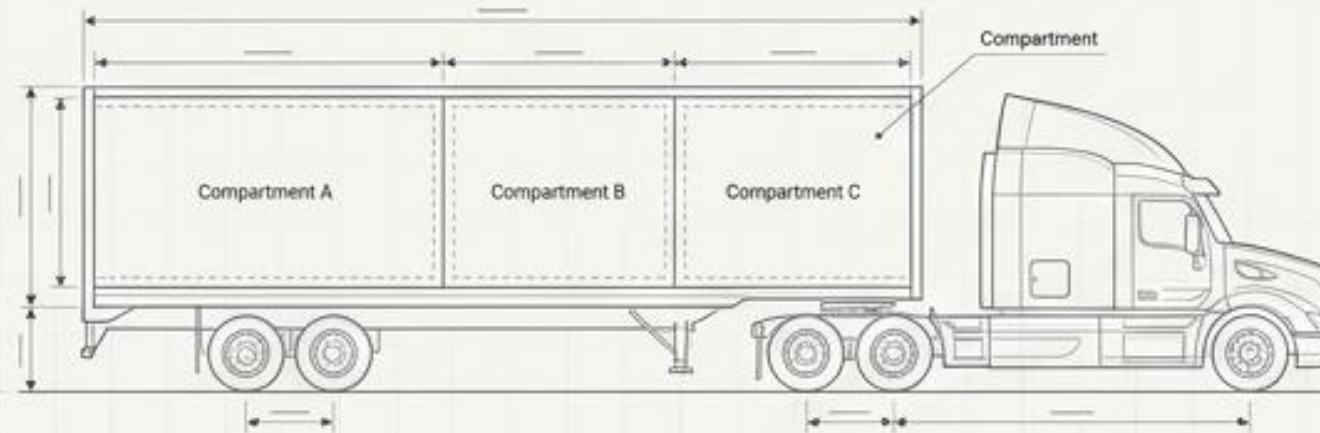

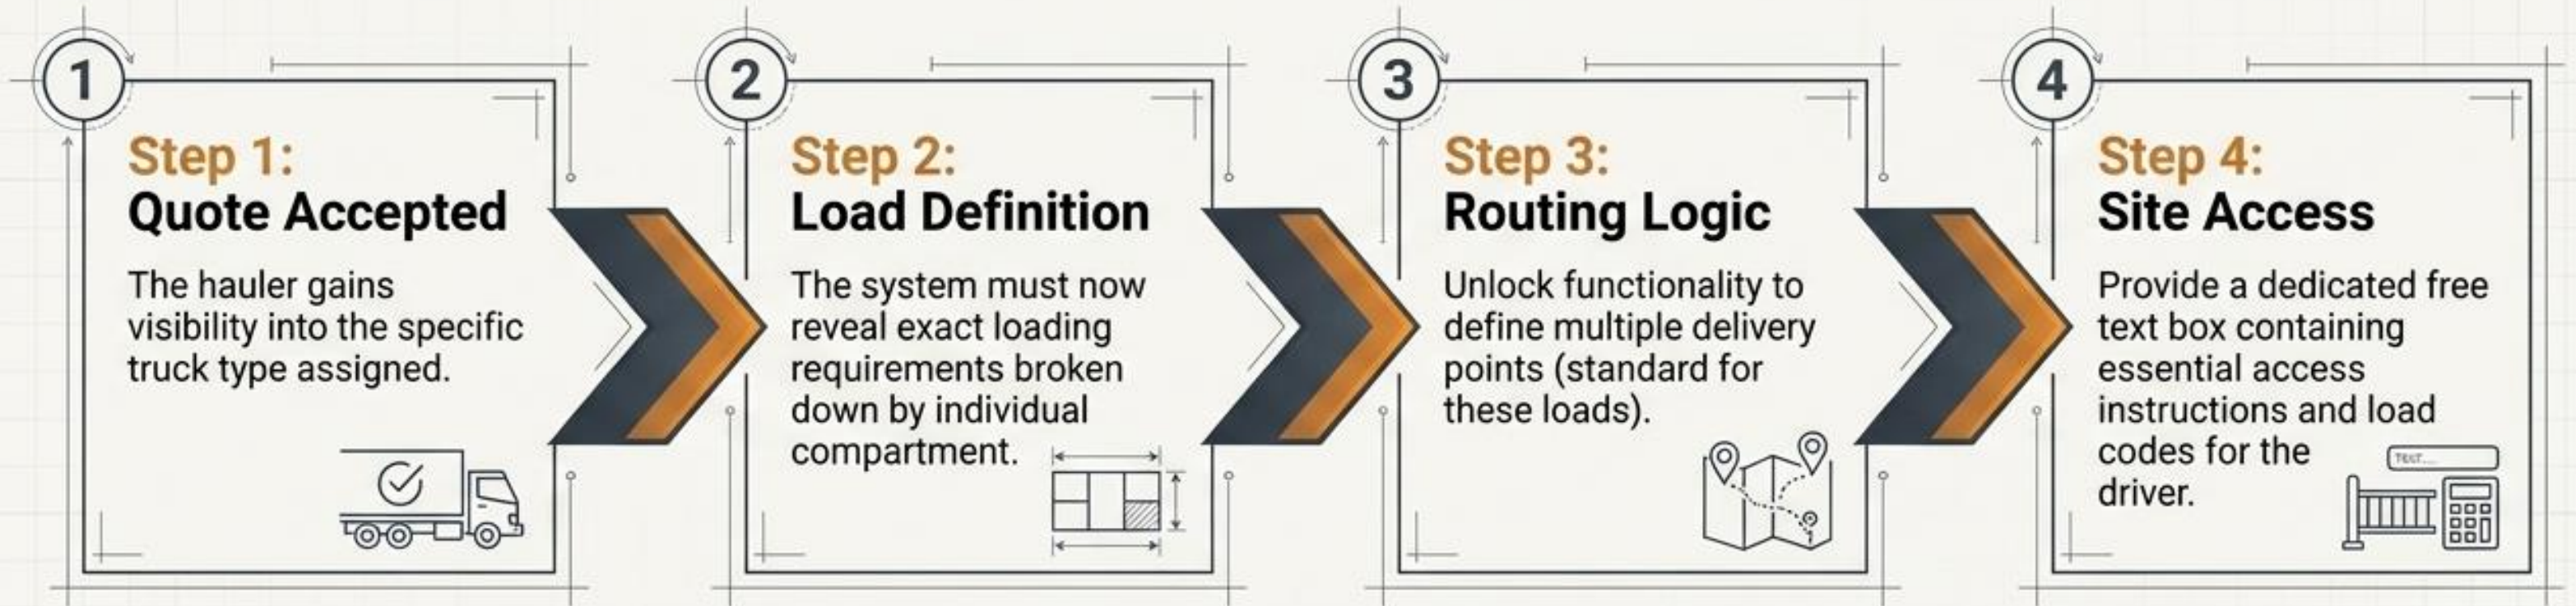

Ensure safe, trackable route execution with immediate emergency support access

Reduce friction in load creation by eliminating redundant data entry

Expose critical logistics and routing data immediately following quotation acceptance

Simplify analytics and enforce strict transactional data compliance for drivers

Analytics Redesign

Keep it simple. Dashboards should exclusively show Loads done (volume/loads), Money spent, and Ratings received. Enable deep-dives via transaction history and add an "Export to Excel" function.

Legal Compliance (Driver Data)

Transition to transaction-based storage. Do not store driver certifications or details beyond the lifecycle of the active job. There must be one centralized place to view active certifications.

Deprecations & Fixes

Delete the "Fleet Management" module entirely.

Resolve the bug preventing users from opening and viewing trips in the "My Jobs" tab.

Triage matrix categorizes immediate UI fixes against strategic feature builds

	Driver App	Web Portal
Quick Wins	Remove schedule UI1 Fix currency formatting2 Enforce 0-star reason0 Check shifts history bug8	Delete Weight/Vehicle fields5 Rename time slots4 Add volume & access text boxes2 Fix 'My Jobs' bug8
Strategic Builds	Geo-location filters0 Multi-drop routing UI5 In-app messaging & calling0	Post-acceptance routing logic6 Driver data retention compliance protocol6 Analytics export functionality0

Immediate actions require design handoffs and targeted alignment sessions

1.

Design Execution

Process UI removals and field additions across **App and Web quotation screens** based on the audit tear-downs.

2.

Technical Feasibility Review

Developers to assess **in-app** navigation constraints versus **external routing API** handoffs.

3.

Schedule Strategic Session

Require an immediate deep-dive meeting (including Abhishek) focused strictly on **Stripe integration**, **Escrow logic**, and the **driver account creation flow**.
