

Refining the Product Journey: Actionable UI & UX Audit

Prioritized design directives and feature roadmaps for
the Driver App and Shipper Web Portal.

This audit traces the chronological user journey. We transition raw field feedback into screen-specific design directives, transforming friction points into structural platform improvements.

Phase 1: The Driver Experience

(Dashboard Setup, Job Discovery, Route Execution, Issue Escalation)

Phase 2: The Shipper Web Portal

(Quotation Flow, Booking Matrices, Administrative Cleanup)

Phase 3: Technical Infrastructure

(Stripe Integrations, Data Persistence)

[REMOVE]

Driver schedule is not needed here.

[MODIFY]

0-stars require a mandatory reason dropdown.

[KEEP]

Leave strictly fact-based (Earnings, ratings, weekly loads). Ensure correct currency displays.

[KEEP]

Retain booking number, date, and quote price.

[ADD]

Driver account setup info is currently missing. Link to Stripe onboarding (Taskforce required).

[ADD]

Geo-location functionality.

[MODIFY]

Restrict visibility. Only show jobs the user is qualified to do (e.g., filter for driver only).

[ADD]

Display the latest delivery time required upfront so drivers can manage schedules effectively.

System Requirements

[ADD]

Pre-Job Communication:

Enable haulier messaging directly on the open job card to agree on start times and truck availability before acceptance.

[MODIFY]

Shift History:

The Shifts page (referenced in navigation) looks visually acceptable, but historical data functionality is missing and requires a secondary technical audit.

The Multi-Drop Logistics Framework

Complex loads require granular tracking. A single trip must systematically break down into multi-point deliveries, attaching specific distances, timelines, and access instructions to individual compartments.

[MODIFY]

Ensure a distinctly clean interface with a highly visible, primary Start Job button.

[ADD]

Enforce location services turned ON upon job start to monitor progress and capture timestamps.

Architecture Query

Navigation Routing:

Open Question for Devs

- Is turn-by-turn navigation happening entirely in-app, or handing off to an external application (Google Maps/Waze)? The UX flow must clarify this transition.

[KEEP]

The app-based Report Issue categorical workflow is good and should be maintained as the primary data logger.

Communication Flow Additions

[ADD] Uber-Style Embedded Calling

Drivers require immediate, frictionless voice contact. Build integrated call functionality directly into the active route screen.

[MODIFY] Fallback System

If VoIP/in-app calling is technically unfeasible for this sprint, provide a highly visible direct support phone number for the driver.

Before & After Functional flow

Current State

DRIVER REQUIREMENT *

Driver Only
Hire a driver — you provide the truck.

Truck with Driver
Hire a driver who brings their own truck.

Truck Only
Hire a truck — no driver services needed.

GOODS TYPE *

e.g. Palletised Goods, Refrigerated Food, Machinery...

TOTAL WEIGHT * (kg)

e.g. 1200

VEHICLE REQUIRED *

Van

COLLECTION DATE *

dd/mm/yyyy

COLLECTION TIME SLOT *

Morning
08:00 - 12:00

Afternoon
12:00 - 18:00

Evening
15:00 - 22:00

Full Day
08:00 - 22:00

New Required State

[REMOVE]

[REMOVE]

[KEEP]

[MODIFY]

Change terminology to 'Deliver By'

[ADD]

Desired Volume (implemented as a free text box to replace total weight).

Refining the Booking Flow: Data Input Matrix

Data Field	Pre-Acceptance (Quotation)	Post-Acceptance	Action Required
Vehicle Required	Removed	N/A	[DELETE]
Total Weight	Removed	N/A	[DELETE]
Desired Volume (Free Text)	Required	Persistent	[ADD]
Collection Date	Required	Persistent	[KEEP]
Time Specification	Deliver By	Persistent	[MODIFY] from 'Collection Time Slot'
Compartment Loading	Hidden	Required	[ADD] (Revealed once hauler sees truck type)
Multiple Delivery Points	Hidden	Required	[ADD]
Access & Load Codes	Hidden	Required	[ADD] (Free text box)

My Jobs

[MODIFY]

Fix critical bug—users currently cannot open trips to view details.

Fleet Management

[REMOVE]

Delete this section entirely from the portal.

Driver Certifications

[MODIFY]

Legal/Compliance update. Store data strictly transaction-based. Do not persistently store driver details beyond the lifespan of the specific job.

Analytics Dashboard

[MODIFY]

Keep it brutally simple. Restrict top-level metrics to: Loads done (volume/count), Money spent, and Ratings received. Allow deep-dives via transaction history.

[ADD]

an Excel download function.

Critical Technical Mandates: The Financial Layer

Task 1: The Stripe Architecture Session

- Driver account setup requires deep Stripe integration.
- **Mandate:** Schedule a dedicated scoping session (Abhishek & Stakeholders) to map the exact payment flows.

Task 2: Escrow Implementation

- The payment screen architecture is contingent on a new Escrow system.
- **Mandate:** Align Stripe setup with Escrow routing rules before finalizing the UI for the web payment screen.

The Core Directives

Pillar 1: Hyper-Relevance

Only show what matters.

Filtering for driver-only jobs, removing unnecessary schedules, and hiding compartment loading until post-acceptance ensures users never suffer cognitive overload.

Pillar 2: Frictionless Communication

Embedded, not external.

Integrating Uber-style calling, direct pre-job messaging with hauliers, and free-text access codes bridges the gap between digital dispatch and physical reality.

Pillar 3: Legal & Financial Clarity

Transaction-bound integrity.

Transitioning driver certifications to purely transaction-based storage, anchoring payments to upcoming Escrow/Stripe architectures, and ensuring strictly fact-based dashboard earnings.
